Urodynamics – after your test

Having a tube passed into your bladder may cause some temporary irritation as your bladder and urethra (the tube through which your urine comes out).

You may find it a little uncomfortable the first few times you pass urine after the test. Your urine can be bloodstained, but this too settles quickly.

There is a slight possibility that you may develop a urine infection, although the majority of women do not. You can try and prevent this this by drinking plenty of water (2 litres or 3 pints a day) for the first two days after the test.

- Pain low in your tummy, burning or stinging on passing urine, cloudy and smelly urine, fever, may suggest an infection. If you feel unwell, contact your GP as you may need an antibiotic course.
